BMI looping

Write a program using a while loop to allow the user to enter more than one set of data.

Keep looping as long as the user types a word starting with the letter Y (case insensitive).

Must match expected output.

```
This program reads data for two people and
computes their body mass index (BMI).

------------------------------------
Enter next person's information:
height (in inches)? 70.0
weight (in pounds)? 194.25

Enter next person's information:
height (in inches)? 70.001
weight (in pounds)? 194.25

Person 1 BMI = 27.87
overweight
Person 2 BMI = 27.87
overweight
The BMI values are the same.

Enter another set? (Y/N) yes
------------------------------------
Enter next person's information:
…
```
